

# Electrons from PW5 muons

Reinhard Schwienhorst  
University of Minnesota

Short report  
E872 phone meeting, 9/14/99

# Outline

- Introduction
- Extraction method
- Example event
- Conclusions
- Outlook

# Introduction

- It has been suggested to use electrons from the data to check my selection cuts
- Electrons are available in the form of  $\nu_e$ CC interactions
  - readily available
  - “contaminated” with hadrons
- Electrons are also available from PW5 muons that produce a shower in a module
  - events have to be extracted
  - known, small contamination from muons

# Extraction method

- Go through PW5 events and re-analyze
- Look for  $> (\text{muon} + 2 \text{ SF lines})$  in each view in a module
  - if there is one muon: at least 3 lines in each view
    - shower
      - require a shower behind module 4
      - selected 140 events out of 45000 in period 4
- Visual scan
  - remove garbage, noise
    - large angle muons, events with no muon
  - keep 106 events

# Conclusions

- Electron showers can be extracted from the PW5 muon data (0.24% of the events)
- The energy of the generated showers is small
  - but the same muon might create several showers

# Outlook

- I will use the extracted 106 events to check my cuts
- I will extract electrons for all run periods
